                                                                                  designated laxiasterisks, of laxiasterisk HWW glutenin, found in certain lines of wheat variety Bankuti 1201. The variant gene (see AAI70852) differs from the laxiasterisk gene by a single point mutation of C to G. This results in a change from Ser to Cys at amino acid position 394 of the encoded protein. Because of this, the newly identified allele provides enhanced possibilities for the formation of disulfide bridges compared with the known allele, which could at least partly the newly identified gene can be used to develop transgenic wheat varieties with better quality gluten.

                                                                                                                                                                                           This amino acid sequence is of the synthetic HWW-glutenin protein which is introduced into the DNA of the cereal to form a non-natural repetitive domain which changes the viscoelastic property of a dough. The domain comprises HWW glutenin subunit repeats which are synthetic in sequence or non-natural in number. The dough is useful for making a wheat flour, wheat dough, bread or noodle.
A process for altering the visco:elasticity of a dough - comprises genetic engineering of a high molecular weight glutenin subunit containing a non-natural repetitive domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                 셤
                                                                                                                                                                      à
                                                                                                                                                                                        8
                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences genomic DNA sequences (ABLi6176-ABL30511), expressed DNA (ABBS7737-ABB72072)
                                                                                                                                                                                                   103 EEAMPPLEKGW---WPW---GRQQQP------PPQGGGGGGGGGYYYPCSRPG-EGY 145
                                                                                                                                                                                                                       107 QOPTPP---GWPPGWQWGAGGNQNQPGFDWVQTGFAPGWNGGGGQG------PGWNGP 155
                                                                                               The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Improving yield of natural conformation of disulphide bridge proteins - obtd. by transformed prokaryotic host cells, by adding thiol reagent, esp. glutathione, to culture medium
                                                                                                                                                                                 30;

Cilastatin inhibits e.g. renal dehydropeptidase (RDP) and in therapy it is administered with the antibitic penem or carbapenem to prevent their inactivation by RDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABL161064 ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins

The peptides of the invention are useful for examining and diagnosing Crohn's disease by recognising a human vacuolar H+ transport ATPase, or human kruppel-like zinc finger protein 300, or rice allergen in a biological sample from a subject. The present amino acid sequence represents a rice polypeptide used in the invention.
                                                                                                                                                                                                                ------GWWP---WGRQQQPPPQGGGGGGGG 133

The present sequence is a flax 2S storage protein.

The present invention relates to a method for expressing non-native genes in flax seeds. The method comprises introducing a chimeric nucleic acid construct containing a seed-specific promoter obtained from flax and a nucleic acid which is non-native to the promoter, into a flax plant cell and growing the plant cell into a mature flax plant capable of setting seed, where the nucleic acid is expressed in the seed under the control of the promoter. The seed-specific promoters obtained from flax are useful for modifying the protein, oil or polysaccharide composition of the flax seeds and seeds of other plant species. The promoters facilitate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         expression of proteins, including sulphur-rich protein that are found in uppins or Brazil nutes in a seed deficient in sulphurous amino acids, peptides having pharmaceutical value such as anticoagulants, antibodies, vaccines, cytokines, growth factors, interleukins, mammalian proteins, including alpha-1-antitrypsin, anti-obesity proteins, haemoglobin, blood proteins, human serum albumin, insulin, lactoferrin, myoglobin, pulmonary surfactants and proteins of industrial value such as alpha-amylase, arabinase, amyloglucosidase, catalase, cellobiohydrolase, pectinases,

The invention relates to methods for attenuating gene expression in a cell using gene targetted double stranded RNA. The double stranded RNA comprises a nucleotide sequence that hybridises under physiologic conditions of the cell to the DNA sequence of the target gene to be inhibited. The method utilises a cell in which dicer or argonaute activities are recombinantly expressed or otherwise ectopically activities are recombinantly expressed or otherwise ectopically activated. Activated RNA interference (RNAi) enzymes such as dicer and argonaute are specifically and potently used for inactivating a cloned gene and proves to be a powerful tool for investigating gene function. Methods are used for attenuating target gene expression in non-embryonic cells suspended in culture or in animals. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  47 QQLQQPQ--QQQQQQPHQQQQQSSRQQPSTSSGGSRASGFQQGGQQQKSQDAEGWTAQKK 104

```
This invention relates to twelve human receptors CDNA sequences
referred to as REPTR-1 to REPTR-12), and the proteins encoded thereby.
The proteins of the invention may have antifinflammatory, cytostatic,
immunosuppressive, antiviral, anti-HIV, antiarthritic, muscular active
general, anticonvulsant, noctropic, neuroprotective, antiallergic
activities. The sequences of the invention may be used to produce REPTR
agonists or antagonists, and the protein sequences may be used to raise
anti-REPTR antibodies. These molecules and the REPTR polymucleotides and
polypeptides of the invention are useful in the diagnosis, treatment and
prevention of gastroincestinal (e.g. gastritis, oesophageal carcinoma,
crohn's disease, irritable bowel syndrome, ulcerative colitis),
endocrine (e.g. hypothalamus disorder, Kallman's disease), autoimmune/
inflammatory (e.g. acquired immune deficiency syndrome (AIDS),
renumatoid arthritis, allergies, osteoarthritis, diabetes mallitus,
multiple sclerosis, systemic lupus erythematosus), cell proliferative
(e.g. cancer), developmental (e.g. Duchenne and Becker muscular
disorders. Numerous other examples of each disorder are given in the
specification. The present sequence represents the human REPTR6 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  85 KFFLCSMYTPICLEDYKKPLPPCRSVCER-----AKAGCAPLMRQYGFAWPD--RMRCD 136

The present invention relates to a novel screening method which enables the identification of biologically active agents which mediate their effect through the activation of genes. The method involves providing a population of cells stably transfected with a nucleic acid encoding a reporter molecule, cloning the transfected with a nucleic acid encoding a reporter molecule, cloning the transfected cells into a cell array, signal generated by the reporter molecule as a result of exposure to the agent. The method is useful in identifying biologically active agents and the genes through which the agents act, in screening potential drugs of the their ability to activate certain drug targets in a high-throughput assay, in identifying relationships between signalling pathways and specific signals that could be useful in eventually directing the differentiation of embryonic stem cells and in toxicology assays by testing for unwanted activation or inhibition of specific signalling pathways. The present sequence is FZD 8 protein used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  81 QQLQDVSRECRC----AAIRSMVRGYEEAMPPLEKGWWPWGRQQQPPPQGGGGGGGGYY 135

neuron disease, heart disease, diabetes, liver disease (e.g. cirrhosis), renal disease and AlDS (acquired immunodeficiency syndrome). The present sequence is represents a Wht or Notch pathway protein (i.e. a ligand for the method of the invention).
                                                                                                                                                                                                                                                                                                                                                                                                                               84
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA.sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                              -----EVER-ORLRDLOCWOEV

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -

Disclosure; SEQ ID NO 15714; 21pp + Sequence Listing; English.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABLi6176-ABL30511), expressed DNA sequences (ABLi6175) and the encoded proteins

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
A; Title: Construction and expression of a synthetic wheat storage protein gene.
A; Reference number: JC4966; MUID:97017127; PMID:8863728
```

A;Accession: JC4966
A; Molecule type: DNA
A;Residues: 1-161 <and></and>
A, Note: the authors translated the codon GAT for residue 12 and GAC for residue 31 as Gl
C, Comment: This protein belongs to one class of wheat prolamines.
C;Superfamily: glutenin

clearing : Errmannia

Nucleic Acids Res. 13:6833-6846(1985).

-- FUNCTION: GLUTENINS ARE THE HIGH WOLECULAR WEIGHT SEED STORAGE PROTEIN OF WHEAT ENDOSPERM. THOUGHT TO BE RESPONSIBLE FOR THE VISCO-ELASTIC PROPERTY OF WHEAT DOUGH.
-- SUBUNIT: DISULIPLE -- BRIDGE LINKED AGREGATES.
-- MISCELLANEOUS: GLUTENINS ARE CODED BY SEVERAL GENES ON EACH OF THE GROUP I CHROMOSOMES OF WHEAT.
-- MISCELLANEOUS: THE MATURE PROTEIN IS CHARACTERIZED BY A LARGE NUMBER OF WELL PRESERVED REPEATS OF THE TWO MOTIFS: GQQPGQ AND
                                                                          1 MAKIAAAAAALCFAALVAVAVCQGEVERQRLRDLQCWQEVQESPLDACRQVLDRQLTGG

J. Biol. Chem. 266:8203-8213(1985).
-!- FUNCTION: GLIADIN IS THE MAJOR SEED STORAGE PROTEIN IN WHEAT.
-!- MISCELLANEOUS: THE ALPHA/BETA-GLIADINS CAN BE DIVIDED INTO 5
HOWOLOGY CLASSES. SEQUENCE DIVERGENCE BETWEEN THE CLASSES IS DUB
TO SINGLE BASE SUBSTITITIONS AND TO DUPLICATIONS OR DELETIONS
WITHIN OR NEAR DIRECT REPEATS. THERE ARE MORE THAN A 100 COPIES OF
THE GENE FOR ALPHA/BETA-GLIADIN PER HAPLOID GENOME.

"Nucleotide sequence of a cDNA encoding an alpha/beta-type gliadin
from hexalloid wheat (Triticum aestivum).";
Plant Mol. Biol. 14:867-868(1990).
-!- FUNCTION: GLIADIN IS THE MAJOR SEED STORAGE PROTEIN IN WHEAT.
-!- FUNCTION: GLIADIN IS THE MAJOR SEED STORAGE PROTEIN IN WHEAT.
-!- MISCELLANEOUS: THE ALPHA/BETA-GLIADINS CAN BE DIVIDED INTO 5
HOMOLOGY CLASSES. SEQUENCE DIVERGENTEEN THE CLASSES IS DUE
TO SINGLE BASE SUBSTITUTIONS AND TO DUPLICATIONS OR DELETIONS
WITHIN OR NEAR DIRECT REPEATS. THERE ARE MORE THAN A 100 COPIES OF
THE GENE FOR ALPHA/BETA-GLIADIN PER HAPLOID GENOME.
